

## 11.2 Calculus with Parametric Curves

We will mainly solve problems involving tangents, area, arc length, and surface area.

### Tangents

In the previous section, we saw that some curves defined by parametric equations  $x = f(t)$  and  $y = g(t)$  can also be expressed, by eliminating the parameter, in the form  $y = F(x)$ . If we substitute  $x = f(t)$  and  $y = g(t)$  in the equation  $y = F(x)$ , we get

$$g(t) = F(f(t))$$

If  $g$ ,  $f$ , and  $F$  are differentiable, the Chain Rule gives

$$g'(t) = F'(f(t))f'(t) = F'(x)f'(t)$$

If  $f'(t) \neq 0$ , we can solve for  $F'(x)$ :

**Definition 11.2.1.** The slope of the tangent to the parametric curve  $y = F(x)$  is  $F'(x)$ .

$$F'(x) = \frac{g'(t)}{f'(t)}$$

This enables us to find tangents to parametric curves without having to eliminate the parameter. We can rewrite the previous equation in an easily remembered form.

**Definition 11.2.2.** We can use this to find tangents to parametric curves without having to eliminate the parameter.

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} \quad \text{if} \quad \frac{dx}{dt} \neq 0$$

The curve has a

- horizontal tangent when  $\frac{dy}{dt} = 0$  (provided that  $\frac{dx}{dt} \neq 0$ )
- vertical tangent when  $\frac{dx}{dt} = 0$  (provided that  $\frac{dy}{dt} \neq 0$ )

This is useful when sketching parametric curves.

**Definition 11.2.3.** We can also find  $\frac{d^2y}{dx^2}$

$$\frac{d^2y}{dx^2} = \frac{d}{dx} \left( \frac{dy}{dx} \right) = \frac{\frac{d}{dt} \left( \frac{dy}{dx} \right)}{\frac{dx}{dt}}$$

**Example 11.2.1.** A curve  $C$  is defined by the parametric equations  $x = t^2$ ,  $y = t^3 - 3t$ .

1. Show that  $C$  has two tangents at the point  $(3,0)$  and find their equations.

2. Find the points on  $C$  where the tangent is horizontal or vertical.
3. Determine where the curve is concave upward or downward.

*Solution.* A curve  $C$  is defined by the parametric equations  $x = t^2$ ,  $y = t^3 - 3t$ .

1. Rewrite  $y = t^3 - 3t = t(t^2 - 3) = 0$  when  $t = 0$  or  $t = \pm\sqrt{3}$ . This indicates that  $C$  intersects itself at  $(3,0)$ .

$$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{3t^2 - 3}{2t} = \frac{3}{2} \left( t - \frac{1}{t} \right)$$

$$t = \pm\sqrt{3} \rightarrow dy/dx = \pm 6/(2\sqrt{3})$$

so the equations of the tangents at  $(3,0)$  are

$$y = \sqrt{3}(x - 3) \quad \text{and} \quad y = -\sqrt{3}(x - 3)$$

2.  $C$  has a horizontal tangent when  $dy/dx = 0$ . In other words, when  $dy/dt = 0$  and  $dx/dt \neq 0$ .  $dy/dt = 3t^2 - 3 = 0$  when  $t^2 = 1$  so  $t = \pm 1$ . This means there are horizontal tangents on  $C$  at  $(1,-2)$  and  $(1,2)$ .  $C$  has a vertical tangent when  $dx/dt = 2t = 0$ , so  $t = 0$ . This means  $C$  has a vertical tangent at  $(0,0)$ .
3. To determine concavity we calculate the second derivative:

$$\frac{d^2y}{dx^2} = \frac{\frac{d}{dt} \left( \frac{dy}{dx} \right)}{\frac{dx}{dt}} = \frac{\frac{3}{2} \left( 1 + \frac{1}{t^2} \right)}{2t} = \frac{3(t^2 + 1)}{4t^3}$$

The curve is concave upward when  $t > 0$  and concave downward when  $t < 0$ .

## Area

We already know that area under a curve  $y = F(x)$  from  $a$  to  $b$  is  $A = \int_a^b F(x)dx$ . We can apply this to parametric equations using the Substitution Rule for Definite Integrals.

**Definition 11.2.4.** If the curve  $C$  is given by parametric equations  $x = f(t)$  and  $y = g(t)$  and  $t$  increases from  $\alpha$  to  $\beta$ ,

$$A = \int_a^b ydx = \int_{\alpha}^{\beta} g(t)f'(t)dt$$

(Switch  $\alpha$  to  $\beta$  if the point on  $C$  at  $\beta$  is more left than  $\alpha$ .)

**Example 11.2.2.** Find the area under one arch of the cycloid  $x = r(\theta - \sin \theta)$ ,  $y = r(1 - \cos \theta)$ .

*Solution.* One arch of the cycloid is given by  $0 \leq \theta \leq 2\pi$ . Using the Substitution Rule with  $y = r(1 - \cos \theta)$  and  $dx = r(1 - \cos \theta)d\theta$ , we have

$$\begin{aligned} A &= \int_0^{2\pi} y dx = A = \int_0^{2\pi} r(1 - \cos \theta)r(1 - \cos \theta)d\theta \\ &= r^2 \int_0^{2\pi} (1 - \cos \theta)^2 d\theta = r^2 \int_0^{2\pi} (1 - 2\cos \theta + \cos^2 \theta) d\theta \\ &= r^2 \int_0^{2\pi} \left[ 1 - 2\cos \theta + \frac{1}{2}(1 + \cos 2\theta) \right] d\theta \\ &= r^2 \left[ \frac{3}{2}\theta - 2\sin \theta + \frac{1}{4}\sin 2\theta \right]_0^{2\pi} \\ &= r^2 \left( \frac{3}{2} \cdot 2\pi \right) = 3\pi r^2 \end{aligned}$$

**Arc Length**

**Surface Area**
